# Author Index

| | | |
|---|---|---|
| Allotta, B. | Train position and speed estimation using wheel velocity measurements | 207–225 |
| Berghuvud, A. | Freight car curving performance in braked conditions | 23–29 |
| Berlitz, T. | Interior air flow simulation in railway rolling stock | 231–236 |
| Bugarín, M. R. | The tram–train: state of the art | 1–13 |
| Bugarín, M. R. | Improvements in railway switches | 275–286 |
| Chen, Y. C. | Contact stress variations near the insulated rail joints | 265–273 |
| Colla, V. | Train position and speed estimation using wheel velocity measurements | 207–225 |
| Dassanayake, H. P. B. | Industrial fault diagnosis: pneumatic train door case study | 175–183 |
| Evans, A. W. | Speed and rolling stock of trains in fatal accidents on Britain's main line railways: 1967–2000 | 81–95 |
| Fararooy, S. | Industrial fault diagnosis: pneumatic train door case study | 175–183 |
| García Díaz-de-Villegas, J.-M. | Improvements in railway switches | 275–286 |
| Goodall, R. M. | Use of multiobjective genetic algorithms to optimize inter-vehicle active suspensions | 53–63 |
| Goodman, C. J. | Industrial fault diagnosis: pneumatic train door case study | 175–183 |
| Griffin, T. | Shared track—a new dawn? | 15–22 |
| Gustavson, R. | Influence of cracked sleepers on the global track response: coupling of a linear track model and non-linear finite element analyses | 41–51 |
| Gylltoft, K. | Influence of cracked sleepers on the global track response: coupling of a linear track model and non-linear finite element analyses | 41–51 |
| Kuang, J. H. | Contact stress variations near the insulated rail joints | 265–273 |
| Lehrasab, N. | Industrial fault diagnosis: pneumatic train door case study | 175–183 |
| Lewis, J. H. | Structural crashworthiness—possibilities and practicalities | 117–121 |
| Lu, G. | Energy absorption requirement for crashworthy vehicles | 31–39 |
| Malvezzi, M. | Train position and speed estimation using wheel velocity measurements | 207–225 |
| Matschke, G. | Interior air flow simulation in railway rolling stock | 231–236 |
| Mei, T. X. | Use of multiobjective genetic algorithms to optimize inter-vehicle active suspensions | 53–63 |
| Muttram, R. I. | Railway Safety's Safety Risk Model | 71–79 |
| Nagase, K. | A study of the phenomenon of wheel climb derailment: results of basic experiments using model bogies | 237–247 |
| Nilsson, R. | Surface cracks and wear of rail: a full-scale test on a commuter train track | 249–264 |
| Novales, M. | The tram–train: state of the art | 1–13 |
| Olofsson, U. | Surface cracks and wear of rail: a full-scale test on a commuter train track | 249–264 |
| Orro, A. | The tram–train: state of the art | 1–13 |
| Polach, O. | Coupled single-axle running gears—a new radial steering design | 197–206 |
| Rasaiah, W. G. | Watershed UK accidents—lessons learned | 109–115 |
| Roberts, C. | Industrial fault diagnosis: pneumatic train door case study | 175–183 |
| Sakahara, H. | A study of the phenomenon of wheel climb derailment: results of basic experiments using model bogies | 237–247 |
| Schmid, F. | An introduction to China's rail transport. Part 1: history, present and future of China's railways | 153–163 |
| Schmid, F. | An introduction to China's rail transport. Part 2: urban rail transit systems, highway transport and the reform of China's railways | 165–174 |
| Smith, R. A. | An introduction to China's rail transport. Part 1: history, present and future of China's railways | 153–163 |
| Smith, R. A. | An introduction to China's rail transport. Part 2: urban rail transit systems, highway transport and the reform of China's railways | 165–174 |
| Sorge, F. | Geometrical analysis of self-compensating suspension systems for railcar engineering | 185–196 |
| Sutton, A. | The development of rail vehicle crashworthiness | 97–108 |
| Tyrell, D. C. | US rail equipment crashworthiness standards | 123–130 |
| Tyrell, D. C. | Rail passenger equipment accidents and the evaluation of crashworthiness strategies | 131–147 |
